

Subject card

Subject name and code	Mathematical methods of physics II - classes, PG_00155367						
Field of study	Physics						
Date of commencement of studies	October 2024		Academic year of realisation of subject		2025/2026		
Education level	Bachelor's studies		Subject group		Obligatory subject group in the field of study		
Mode of study	full-time studies		Mode of delivery		at the university		
Year of study	2		Language of instruction		Polish		
Semester of study	4		ECTS credits		2.0		
Learning profile	academic		Assessment form		credit		
Conducting unit	Division of Mathematical Methods of Physics -> Institute of Theoretical Physics and Astrophysics -> Faculty of Mathematics, Physics and Informatics -> Rector						
Name and surname of lecturer (lecturers)	Subject supervisor		dr Krzysztof Szczygielski				
	Teachers		dr Yaser Tavakoli				
Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	0.0	30.0	0.0	0.0	0.0	30
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	30		0.0		30.0	60
Subject objectives	Acquiring the ability to operate with concepts, theorems and methods of functional analysis presented in the lecture Mathematical Methods of Physics II by solving selected problems.						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[FIZL3_W04] knows the basic techniques of higher mathematics, including differential and integral calculus of functions of one and many variables, and the basics of algebra to the extent necessary to describe physical phenomena and solve physical problems	The student knows: basic structures used in linear algebra, topology and measure theory, basics of Banach space theory: the concept of metric, norms, completeness, Holder and Minkowski inequalities, basics of Hilbert space theory, the concept of dual space and linear functional, Riesz representation theorem, definition and examples of linear mappings, bounded operators, the concept of the resolvent operator, operator spectrum, definition of eigenproblem and types of spectra, properties of self-adjoint and unitary operators, applications and properties of orthogonal polynomials, elements of distribution theory.	[SW3] text preparation/written work
	[FIZL3_U08] can use mathematical apparatus and numerical methods to describe and model physical phenomena and processes	The student is able to: give and characterize the basic concepts of the theory of Hilbert and Banach spaces, use the conceptual apparatus of functional analysis in Hilbert space, characterize the operator's eigenproblem and the concept of spectrum and justify the significance of self-adjoint operators in quantum mechanics, define the concept of distribution and give their examples, define the concept of orthogonal polynomials and give their examples.	[SU3] text preparation/written work
	[FIZL3_K08] is able to speak competently on basic problems of physics and its applications	The student knows/understands/is aware of: that theorems and methods of inference developed by mathematics have a direct impact on the way of understanding physical phenomena occurring in the surrounding world, is aware of the importance of functional analysis and operator theory in various aspects of effective modeling of natural reality.	[SK3] text preparation/written work
	[FIZL3_U16] can independently plan and implement his own learning	The student is able to: give and characterize the basic concepts of the theory of Hilbert and Banach spaces, use the conceptual apparatus of functional analysis in Hilbert space, characterize the operator's eigenproblem and the concept of spectrum and justify the significance of self-adjoint operators in quantum mechanics, define the concept of distribution and give their examples, define the concept of orthogonal polynomials and give their examples.	[SU3] text preparation/written work
	[FIZL3_U02] has the ability to perform measurements of basic physical quantities; can develop, describe and present the results of simple physical experiments and computer simulations; can perform quantitative analyses and formulate qualitative conclusions on this basis; can estimate measurement uncertainties	The student is able to: give and characterize the basic concepts of the theory of Hilbert and Banach spaces, use the conceptual apparatus of functional analysis in Hilbert space, characterize the operator's eigenproblem and the concept of spectrum and justify the significance of self-adjoint operators in quantum mechanics, define the concept of distribution and give their examples, define the concept of orthogonal polynomials and give their examples.	[SU3] text preparation/written work

	Course outcome	Subject outcome	Method of verification
	[FIZL3_K02] can precisely formulate problems to deepen understanding of a given topic	The student knows/understands/is aware of: that theorems and methods of inference developed by mathematics have a direct impact on the way of understanding physical phenomena occurring in the surrounding world, is aware of the importance of functional analysis and operator theory in various aspects of effective modeling of natural reality.	[SK3] text preparation/written work
	[FIZL3_W02] understands the role of physical experiments, mathematical theoretical models approximating reality and computer simulations in the methodology of scientific research; is aware of technological, equipment and methodological limitations in scientific research	The student knows: basic structures used in linear algebra, topology and measure theory, basics of Banach space theory: the concept of metric, norms, completeness, Holder and Minkowski inequalities, basics of Hilbert space theory, the concept of dual space and linear functional, Riesz representation theorem, definition and examples of linear mappings, bounded operators, the concept of the resolvent operator, operator spectrum, definition of eigenproblem and types of spectra, properties of self-adjoint and unitary operators, applications and properties of orthogonal polynomials, elements of distribution theory.	[SW3] text preparation/written work
	[FIZL3_K01] knows the limitations of his own knowledge and understands the need for further education	The student knows/understands/is aware of: that theorems and methods of inference developed by mathematics have a direct impact on the way of understanding physical phenomena occurring in the surrounding world, is aware of the importance of functional analysis and operator theory in various aspects of effective modeling of natural reality.	[SK3] text preparation/written work
Subject contents	1. Theory of Banach and Hilbert spaces 2. Linear operators and functionals 3. Spectrum of linear operator, eigenvectors and eigenvalues 4. Self-adjoint and unitary operators 5. Compact, trace class and Hilbert-Schmidt operators 6. Orthogonal polynomials. Properties and applications 7. Elements of theory of distributions with applications		
Prerequisites and co-requisites	Knowledge of linear algebra and mathematical analysis at the level of the first three semesters of studies in the field of Physics. Earlier completion of the course Mathematical Methods of Physics I.		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	not applicable	51.0%	100.0%
