

Subject card

Subject name and code	Mathematical Applications in Economics and Management, PG_00174003						
Field of study	Logistics and Mobility						
Date of commencement of studies	October 2025		Academic year of realisation of subject		2025/2026		
Education level	Bachelor's studies		Subject group		Obligatory subject group in the field of study Subject group related to scientific research in the field of study		
Mode of study	full-time studies		Mode of delivery		at the university		
Year of study	1		Language of instruction		English		
Semester of study	1		ECTS credits		2.0		
Learning profile	academic		Assessment form				
Conducting unit	Department of Microeconomics -> Faculty of Economics -> Rector						
Name and surname of lecturer (lecturers)	Subject supervisor		dr hab. Leszek Czerwonka				
	Teachers		dr hab. Leszek Czerwonka				
Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	15.0	0.0	0.0	0.0	0.0	15
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	15		5.0		30.0	50
Subject objectives	Acquainting students with the introduction to higher mathematics and its applications in economics and management. Use of academic English language, references and vocabulary.						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[LML3_U02] is able to use its theoretical knowledge and acquire data to analyze specific logistics and mobility processes and systems, and to analyze these processes and systems using methods developed in economics, finance, management science, logistics and mobility	A student is able to apply mathematical and statistical methods to analyze data describing economic processes and management systems, including in the areas of logistics and mobility. The student can acquire and interpret data using approaches appropriate to economics and finance.	[SU4] test/exam - oral or written
	[LML3_W06] knows to an advanced degree selected methods and tools, including statistical techniques, to describe and model logistics and mobility processes and systems	A student knows selected mathematical and statistical methods used to describe and model economic processes and management systems, including those related to logistics and mobility.	[SW4] test/exam - oral or written
	[LML3_K04] is ready to think and act in an entrepreneurial manner; adapts to new situations and conditions, takes on the challenges of creative thinking, is resilient to failure, knows how to identify threats and assess the risk of their occurrence	A student is able to think analytically and take entrepreneurial action in solving mathematical problems in economics and management; can assess risk and adapt analytical methods to changing market and informational conditions. A student studies additional examples and tasks, which are discussed and reviewed during office hours with the teacher.	[SK1] oral statement/conversation/discussion [SK4] test/exam - oral or written
Subject contents	1. Matrix algebra Matrix operations, basic properties of determinants, finding the inverse matrix, Cramer's formula, application to market and national income models (matrix notation and model solution) 2. Sequences and series Concept of a numerical sequence, arithmetic and geometric sequences, convergence of a sequence, operations on the limits of sequences, concept of a numerical series, sum of a series, application to the calculation of the present value of cash flows (elements of financial mathematics) 3. Functions of one and many variables Basic elementary functions, graph of a function, inverse representation, monotonicity, limit of a function, continuity of a function, convexity and concavity of a function 4. Elements of differential calculus Rules of differentiation for functions of one variable, local extrema of functions of one variable, elasticity of functions, marginal calculus, maximisation of economic result, rules of differentiation for functions of many variables, optimisation of functions of many variables, conditional extremum, minimisation of costs by Lagrange multipliers method 5. Integral calculus Concept of primary function, definite and indefinite integral, method of integration by parts, method of integration by substitution, applications in marginal calculus and financial mathematics 6. Differential equations Differential equations, application of differential equations in economic growth models. Questions that arise during the reflection and repetition of the course content or interpretative problems accompanying it will also be addressed during office hours.		
Prerequisites and co-requisites	Recommended knowledge in mathematics: Functions of One Variable, Functions of Many Variables, Foundations of Differential Calculus, Solving Systems of Linear Equations.		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Test	51.0%	100.0%
