University of Gdańsk

Subject card

Subject name and code	Linear Algebra with Geometry I, PG_00204248		
Field of study	Mathematics		
Date of commencement of studies	October 2026	Academic year of realisation of subject	2026/2027
Education level	Bachelor's studies	Subject group	Obligatory subject group in the field of study Subject group related to scientific research in the field of study
Mode of study	full-time studies	Mode of delivery	at the university
Year of study	1	Language of instruction	Polish możliwość prowadzenia przedmiotu w języku angielskim
Semester of study	1	ECTS credits	7.0
Learning profile	academic	Assessment form	exam
Conducting unit	Faculty of Mathematics, Physics and Informatics -> Rector		
Name and surname of lecturer (lecturers)	Subject supervisor	dr hab. Ewa Tyszkowska	
	Teachers	dr Ewa Kozłowska-Walania mgr Jakub Szmelter-Tomczuk dr hab. Ewa Tyszkowska	

Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	45.0	0.0	0.0	0.0	75
	E-learning hours included: 0.0						

Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM
	Number of study hours	75	4.0	96.0	175

Subject objectives	The course aims to introduce students to the concepts, theorems, and methods of linear algebra concerning linear spaces, matrices, linear transformations, and systems of linear equations.

Learning outcomes

Course outcome	Subject outcome	Method of verification
[MATL3_W07] knows and understands at an advanced level the role and importance of proof in mathematics, as well as the concept of the importance of assumptions	The student knows the proofs of selected theorems in linear algebra. He or she can independently justify selected statements using given assumptions.	[SW1] oral statement/ conversation/discussion [SW5] implementation of a problem task
[MATL3_U03] is able to correctly use the concepts of linear algebra and analytic geometry, is able to apply the theorems and methods of these fields and is able to interpret the obtained results	The student is able to correctly use the concepts learned from the theory of linear spaces, matrices and linear equations when solving practical problems.	[SU4] test/exam - oral or written [SU6] demonstration of practical skills
[MATL3_U06] can formulate definitions and theorems in an understandable manner, both orally and in writing, and present correct mathematical reasoning on the learned topics	The student formulates definitions and theorems and presents correct mathematical reasoning concerning linear algebra .	[SU1] oral statement/conversation/ discussion [SU8] observation of student's independent or team work
[MATL3_W03] knows and understands at an advanced level selected concepts, methods and theorems of linear algebra and analytic geometry, as well as basic examples both illustrating specific concepts in this field and allowing to refute false hypotheses or invalid reasoning	The student knows and understands selected concepts, methods and theorems related to linear algebra, is able to provide examples illustrating the definitions learned, is able to apply the theorems learned in solving problems, uses the "indirect" method to refute erroneous reasoning.	[SW4] test/exam - oral or written

Subject contents

1. Basic algebraic structures: groups, rings, and fields, permutation group, the Zn ring.
2. The field of complex numbers: algebraic and trigonometric form of a complex number, Moivre's formula, exponentiation and square roots of complex numbers.
3. The concept of an abstract linear space over a field. Linear independence of vectors, linear subspaces generated by systems of vectors, basis and dimension of a linear space, quotient spaces.
4. Matrices and their operations. The inverse matrix and the algorithm for determining the inverse matrix. Matrix equations and their connection to systems of linear equations.
5. The determinant of a matrix. Properties and methods for calculating determinants. Applications of determinants. Cramer's rule.
6. The rank of a matrix. Methods for calculating the rank of a matrix and applications.
7. Systems of linear equations and methods for solving them - the Gauss-Jordan elimination method, the Kronecker-Capelli theorem.
8. Linear transformations. Image and kernel of a linear transformation. Matrix representation of linear transformations.

Prerequisites and co-requisites

Assessment methods and criteria

Subject passing criteria	Passing threshold	Percentage of the final grade
observation of the student's attitude	51.0%	0.0%
tests	51.0%	30.0%
exam	51.0%	40.0%
quizzes	51.0%	20.0%
activity in classes	51.0%	10.0%
